

More and more, your data no longer provides a window into your organization; it is your organization's mission. Therefore, the more information and knowledge extracted from your organization's data, the more value derived to benefit your organization. It is estimated that today 60 – 80% of an organization's value is tied up in its information. Metrics are no longer enough. A comprehensive strategy built on a framework to manage your data and its quality is the new normal.

We provide a comprehensive suite of enterprise data management capabilities that motivate your people to actualize the economic value of your organization's data, information, and knowledge. We recognize quality data and information as a currency that facilitates better decision-making.

Data Management Capabilities

Our Framework consist of establishing, designing, empowering, and utilizing your data.

- **Establishing** – The fundamental activities needed to ensure the organization understands data is an asset that holds value.
- **Designing** – The activities needed to align business strategy and requirements for what data needs to be managed.
- **Empowering** – Maximizing the data flow in your organization.
- **Utilizing** – Making your organization more in sight-driven and learning-oriented.

Find what you need, when you need it with Enterprise Search

Organizations often overlook or miscomprehend how to provide users with a single place to find critical information. We combine User-Centered Design, Search best practices, and future-leaning technologies like A.I. and Machine learning to improve your data's findability, making it easy for you to:

- Manage a distributed workforce's ability to find content across multiple data sources and platforms.
- Empower your workforce to explore, understand, and discover new insights; and empower your business with semantic search capabilities by asking natural language questions.

iPORTER, INCA Tech's Performant Organizer for Real-Time Electronic Records Tool

Imagine going from five thousand search results to ten in just three clicks, here's how to do it. INCA TECH developed iPORTER to organize your ever-growing collection of knowledge and data strategically by:

We examine your content

We tag & labeled your data

We design a data model for metadata

We indexed your content for search (SharePoint)

iPORTER is built on readily available Commercial off-the-shelf (COTS) SharePoint Web Parts, our in-depth knowledge of data design, information architecture, and the SharePoint Term Store.

iPORTER enables your SharePoint web administrators and designers to manipulate and improve search for your organization in little time.

Data proliferation is at the highest it's ever been. Only three percent of the proliferated data in your organization meet data quality standards; 60-73% of this data will never be used for any strategic purpose. How do you position your organization to:

- Handle these large amounts of data
- Derive actionable intelligence from this data
- Secure this data
- Find the people that can manage this data

We are data-rich, information and knowledge poor. On average, employees spend 33-35% of their time searching for the proper knowledge to perform their duties.

By overcoming these challenges

- You democratize data, making it easier for your stakeholders to find and use this information through search.
- You save your time
- You save your money
- You maximize your organization's value

iPORTER

Reduces time to findability in search using managed metadata and data filters

Enables better data security

Identifies redundant data sources

Improves knowledge retention and retrieval within your organization
